

**Talk**

The process of asking and answering questions gives you and your child chances to talk together. Conversation and interaction with you provide many chances for your child to learn.

The next time your child asks a question about how something works, you might say, "I'm not sure—let's find it out." In this way, you are helping your child use the scientific method and discover something for him or herself.

## Fun with Science

# Sinking and Floating

Today we experimented with Halloween candy to see what would sink and what would float in water. Some things to try at home:

- Test a candy to see if it floats in water. If it floats, can you make it sink? If it sinks, can you make it float?
- Fill a clear container with a layer of corn syrup, a layer of colored water, and a layer of oil. Gently place a candy on top and see what happens. Predict which candies will float on each layer and then test your predictions to see if you're right.
